FACULTAD DE INGENIERIA  
EXAMENES PROFESIONALES  
60-1-266

Al Pasante señor JOSE SERGIO SIERRA ATTIANO,  
P r e s e n t e .

En atención a su solicitud relativa, me es grato transcribir a usted a continuación el tema que aprobado por esta Dirección propuso el Profesor Ing. Pedro Luis Benítez Esparza, para que lo desarrolle como tesis en su Examen Profesional de Ingeniero CIVIL.

"PROCEDIMIENTO DE MONTAJE PARA LA ESTRUCTURA METALICA DEL --  
NUEVO HOSPITAL DE PEMEX"

1. Introducción.
2. Antecedentes.
3. Especificaciones de construcción.
4. Secuencia del procedimiento constructivo.
5. Recursos de mano de obra, materiales y equipo.
6. Análisis de precios unitarios.
7. Establecimiento de áreas internas y caminos de acceso.
8. Secuencia de montaje.
9. Programa de ingresos y egresos.
10. Conclusiones.

Ruego a usted se sirva tomar debida nota de que en cumplimiento de lo especificado por la Ley de Profesiones, deberá prestar Servicio Social durante un tiempo mínimo de seis meses como requisito indispensable para sustentar Examen Profesional; así como de la disposición de la Dirección General de Servicios Escolares en el sentido de que se imprima en lugar visible de los ejemplares de la tesis, el título del trabajo realizado.

A t e n t a m e n t e  
"POR MI RAZA HABLARA EL ESPÍRITU"  
Cd. Universitaria, 7 de agosto de 1980  
EL DIRECTOR

ING. JAVIER JIMENEZ ESPRITU

JJE/OBJH/Ser

## 1.- I N T R O D U C I O N .

En el México moderno, el auge extraordinario que está alcanzando la construcción, está motivado por el continuo adelante en el conocimiento de nuevas técnicas y elementos en el diseño de obras de Ingeniería.

El notable avance en el descubrimiento de nuevos materiales asegura paulatinamente la creación de obras, que en el pasado hubiesen resultado utópicos de realizar.

El hombre moderno ya no está solo, el incremento fantástico de comunicaciones y logros científicos lo ubican en la sociedad actual, con un mayor bienestar habitacional por medio de las grandes obras de infraestructura se reduce la separatividad del hombre con el hombre, que existía en épocas pasadas.

El propósito de este trabajo es mostrar de una manera sencilla el montaje de un edificio y que sea una ayuda a las personas que lo consulten ya que este es un tema muy interesante.

2.- A N T E C E D E N T E S .

PEMEX consciente de que sus trabajadores requieren de mejores servicios médicos se ha propuesto la construcción de un Hospital al Sur de la Ciudad de México, y estará localizado en Boulevard Adolfo López Mateos No. 4091 cerca del cruce con camino a Santa Teresa.

Este Hospital contará con las técnicas más avanzadas, los equipos más modernos que junto con médicos competentes brindarán a los trabajadores de PEMEX un excelente servicio médico, los cuales serán para atender de 50,000 a 60,000 derechohabientes.

El terreno en el cual se edificará el Hospital, está localizado en la zona denominada de Lomas, encontrando ahí un enorme estrato de basalto, el cual es de muy buena calidad, para cimentar sobre él.

### 3.- Especificaciones de Construcción.

Estas especificaciones cubren los requisitos constructivos mínimos para materiales, fabricación, inspección, calificación - transporte y montaje de estructuras, no están incluidos recipientes a presión ni aquellas estructuras donde la repetición de ciclos de carga y descarga puede causar fatiga del material. Estas especificaciones se complementarán con lo señalado por los planos, y/o especificaciones particulares.

#### I. MATERIALES

A.- Acero estructural. Se aprueban para uso dentro de esta - especificación los materiales incluidos en la siguiente lista:

|              |   |
|--------------|---|
| A 36         | Acero Estructural   |
| A 53 Grado B | Tubería de acero soldada y sin costura  |
| A 242        | Acero Estructural de alta resistencia   |
| A 440        | Acero Estructural de alta resistencia   |
| A 441        | Acero estructural de alta resistencia y baja aleación de manganeso y vanadio  |
| A 500        | Tubería estructural de acero al carbón formado en frío, soldada y sin costura |
| A 501        | Tubería estructural de acero al carbón formada en caliente y sin costura      |

|                    |   |
|--------------------|---|
| A 514              | Placa de acero de aleación de alta resistencia a la fluencia templada por inmersión y apropiada para soldar.                                      |
| A 529              | Acero estructural con esfuerzo de --- fluencia mínimo de 2950 kg/cm <sup>2</sup> .  |
| A 570 grados D y E | Lámina y solera de acero al carbón laminadas en caliente.   |
| A 572              | Aceros de calidad estructural, de alta resistencia y baja aleación de cromo y vanadio.  |
| A 588              | Acero estructural de alta resistencia y baja aleación con esfuerzo de fluencia mínimo de 3515 kg/cm <sup>2</sup> y hasta --- 10.2 cm. de espesor. |
| A 618              | Tubería estructural soldada y sin costura de alta resistencia y baja aleación formada en caliente.  |
| B.- Pernos.-       | Los pernos de acero de alta resistencia cumplirán una de las siguientes - especificaciones ASTM.  |
| A 325              | Pernos de alta resistencia para juntas de acero estructural incluyendo tueras apropiadas y rondanas aceradas simples endurecidas.                 |
| A 490              | Pernos templados por inmersión, de -- acero de aleación, para juntas de acero estructural.  |

Los demás pernos, sujetadores y pasadores estarán de acuerdo -

con la especificación A S T M A 307

C.- Remaches. Los remaches cumplirán la especificación para remaches estructurales ASTM A 502 Grado 1 6 2.

D.- Soldadura. Los electrodos para soldadura manual de arco protegido, estarán de acuerdo con las últimas ediciones de las siguientes especificaciones AWS: A 5.1, Especificación para electrodos recubiertos de acero dulce, para soldadura al arco, o A 5.5, especificación para electrodos recubiertos de acero de baja aleación, para soldadura al arco.

Los electrodos desnudos y el fundente granular empleados en el proceso de arco sumergido estarán de acuerdo con la clasificación F 60 ó F 70, de las especificaciones AWS, especificación para electrodos desnudos de acero dulce, y fundentes para soldadura con arco sumergido.

## II FABRICACION.

### A.- Aspectos Generales.

- 1.- Se observarán todos los párrafos aplicables de esta sección en la producción e inspección de piezas y estructuras soldadas, fabricadas mediante cualquiera de los procesos aceptados en esta especificación.
- 2.- Todo el equipo que se vaya a emplear para soldar o cortar con oxígeno deberá diseñarse y fabricarse de tal forma, y estará en tal condición, que permitirá a soldadores, operadores y punteadores calificados seguir -

los procedimientos y obtener los resultados prescritos en esta especificación.

3.- No deberá soldarse cuando la temperatura ambiente sea menor de 18°C ( 0°F ) cuando las superficies estén mojadas o expuestas a la lluvia ,nieve o viento fuerte,- ni cuando los soldadores estén expuestos a condiciones inclementes.

4.- Los tamaños y longitudes de las soldaduras no serán menores que las especificadas por los requisitos de diseño y en los dibujos de detalle,ni serán apreciablemente mayores, a menos que se aprueben los cambios correspondientes. Tampoco se cambiará la posición de soldaduras sin aprobación previa de PEMEX.

### III PREPARACION DEL METAL BASE.

1.- Las superficies y bordes que se vayan a soldar deberán estar lisos y uniformes, y libres de rasgaduras, grietas u otros defectos que pudieran afectar de forma adversas la calidad o resistencia de la soldadura. Las superficies que se vayan a soldar y las adyacentes a una soldadura estarán también libres de escamas sueltas u otros materiales extraños que pudieran evitar una -- soldadura apropiada o produzcan humos objetables.

#### 2.- Corte con Oxígeno.

En todos los cortes con oxígeno, la fiama de corte debe rá ajustarse y manipularse para evitar cortar hacia -- dentro de las líneas prescritas. La rugosidad de las superficies cortadas con oxígeno no será mayor que la definida por el AN 51 ( American National Standards -- Institute) como valor de rugosidad de 1 000 MU pulg. - para material hasta de 10.2 cm ( 4 pulg) y 2 000 MU -- pulg. para material de 10.2 cm ( 4 pulg.) a 20.4 cm -- ( 8 pulg.) de espesor, excepto los extremos en sus extremos, los que deberán cumplir con el valor de 2 000 MU pulg.

El corte con oxígeno deberá hacerse, de preferencia -- con máquina. Los bordes cortados con oxígeno que vayan a estar sujetos a esfuerzos importantes, o en los que se vaya a depositar soldadura, deberán estar razonablemente libres de muescas. Todas las esquinas entrantes deberán redondearse con un radio no menor de 13 mm -- ( 1/2 pulg. ).

- 3.- Para la preparación de las juntas, limpieza de la raíz de soldaduras y remoción de trabajo defectuoso, puede emplearse maquinado, corte con chorro de aire u oxígeno o esmerilado; para aceros templados no debe emplearse corte con oxígeno.
- 4.- Los bordes de las almas de vigas y trabes armadas deberán cortarse con la contraflecha prescrita, teniendo - en cuenta las contracciones por corte y soldadura que se presentarán posteriormente sin embargo, se pueden - corregir desviaciones pequeñas de la contraflecha mediante una aplicación de calor cuidadosamente supervisada.
- 5.- No se requiere aplanar o acabar los bordes de placas - cortados con cizalla o gas a menos que así se pida en los planos, o que esté estipulado en la preparación del borde para soldadura.
- 6.- En las juntas sometidas a compresión en las que ésta - se transmite por contacto, las áreas de contacto se prepararán para que tengan una superficie común, mediante maquinado, corte u otros medio apropiado.

#### IV. ENSAMBLADO.

- A.- Las piezas que se vayan a unir mediante soldaduras de filete deben colocarse en un contacto tan íntimo como sea posible. La separación entre las piezas no excede rá, en general 5 mm ( 3/16 pulg.), salvo cuando se tengan perfiles o placas con espesor de 76 mm ( 3 pulg.)- o mayor, en los que la separación no puede reducirse lo suficiente para cumplir con esta tolerancia al ensamblarlos después de enderezarlos. En estos casos se acepta una separación máxima de 8 mm ( 5/16 ), siempre que se emplee soldadura de respaldo o un material apropiado de respaldo para evitar que se escurra la soldadura fundida.
- B.- Las piezas que se vayan a unir mediante soldaduras de penetración parcial paralelas a la longitud de la pieza, exceptuando juntas en las que la transmisión de esfuerzos sea por contacto directo, deben colocarse en un contacto tan íntimo como sea posible. La separación entre piezas no debe exceder 5 mm ( 3/16 pulg.), salvo en perfiles laminados o placas con espesor igual o mayor de 76 mm ( 3 pulg.), que después de haber sido enderezados y ensamblados no pueden acercarse suficientemente para cumplir con la tolerancia.
- C.- Las partes que se vayan a unir mediante soldadura a tope de penetración se alinearán cuidadosamente. Cuando las piezas estén restringidas de manera efectiva contra flexión debida a excentricidad de la alineación, puede permitirse un desplazamiento con respecto al alineamiento teórico que no exceda de 10% del espesor de la pieza unida más delgada, pero en ningún caso mayor de 3 mm - ( 1/8 pulg.).

D.- Las dimensiones de la sección transversal de juntas - soldadas de penetración que varién más de las siguientes tolerancias, respecto a lo que aparece en los planos de detalles, deberán someterse a consideración de PEMEX para su aprobación y/o corrección (Tabla 1).

TABLA 1.

|  | Raíz no vaciada vuelta a depositar.          | Raíz vaciada y vuelta a depositar.           |
|--|--|--|
| 1.- Cara de raíz - de la junta.                            | + 2 mm ( 1/16 pulg.)<br>- 2 mm ( 1/16 pulg.) | No limitada.                                 |
| 2.- Abertura de la raíz en juntas sin respaldo - de acero. | + 2 mm ( 1/16 pulg.)<br>- 3 mm ( 1/8 pulg.). | + 2 mm ( 1/16 pulg.)<br>- 3 mm ( 1/8 pulg.). |
| Abertura de la raíz en juntas con respaldo - de acero.     | + 6 mm ( 1/4 pulg.)<br>- 2 mm ( 1/16 pulg.)  | No aplicable.                                |
| 3.- Anqulo de la ranura de la junta.                       | + 5 grados<br>- -                            | + 10 grados<br>- 5 grados.                   |

E.- Las ranuras para soldaduras de penetración producidas mediante vaciado deberán estar de acuerdo con las dimensiones del perfil de ranuras que aparecen en las figuras 1 a 8 .

OT

JUNTAS SOLDADAS DE PENETRACION COMPLETA  
EN MATERIAL DE ESPESOR NO LIMITADO  
(Soldadura manual con electrodos recubiertos)

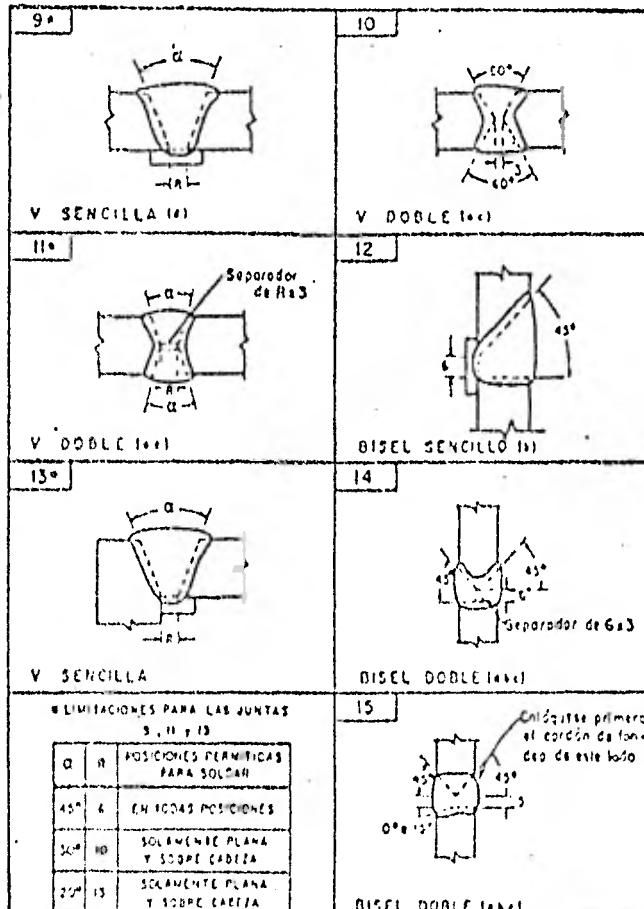

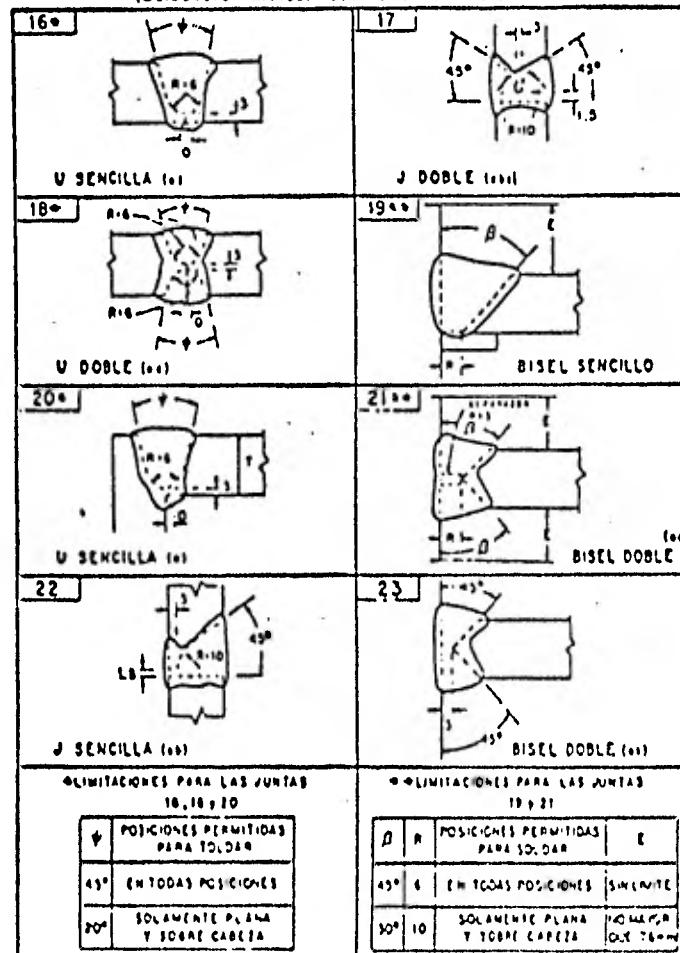

Figura 2

JUNTAS SOLDADAS DE PENETRACION COMPLETA  
EN MATERIAL DE ESPESOR NO LIMITADO  
(Soldadura manual con electrodo recubierto)

- (a) Limpiar la raíz antes de soldar el segundo lado
- (b) Poco grueso horizontalmente
- (c) Esta junta debe limitarse, de preferencia, a material base de espesor no menor de 16 mm
- (d) El ancho de los espesores de flanque utilizados para reforzar trinchaduras de penetración en juntas, en "T" o en esquinilla será igual a T/4, con un máximo de 10 mm
- (e) Adicionalmente en "T"

(Soldadura manual con electrodo recubierto)

Figura 7

JUNTAS DE PENETRACION INCOMPLETA  
(Soldadura de arco sumergido)

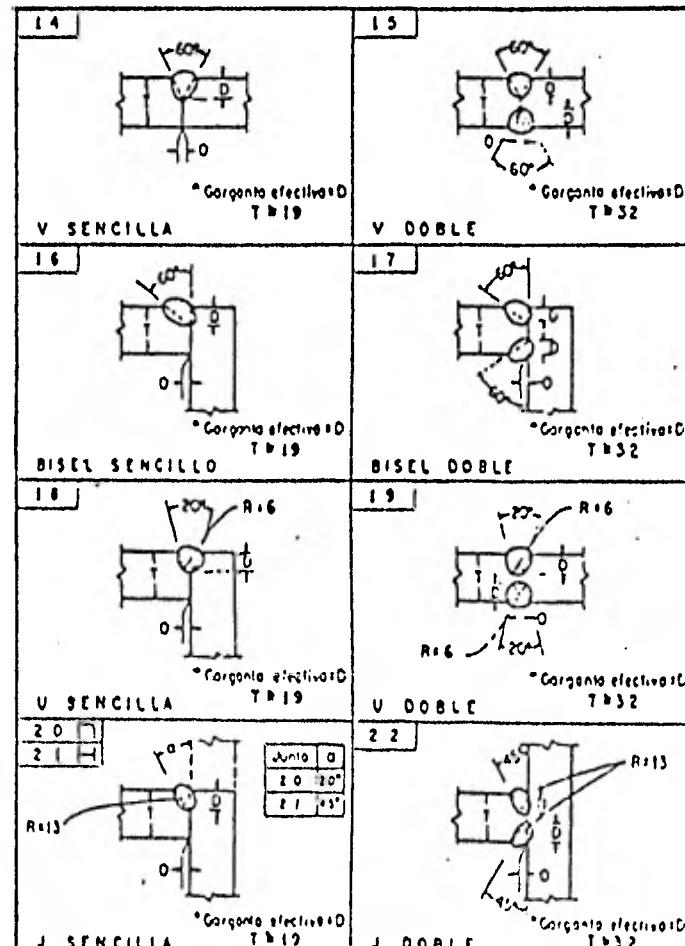

Figura 8

F.- Los miembros que se vayan a soldar estarán correctamente alineados y se mantendrán en posición mediante pernos, prensas, cuñas, contraventos, puntales, otros dispositivos apropiados, o puntos de soldadura, hasta terminar la colocación de la soldadura.

G.- Puntos de Soldadura.

G.1. Los puntos de soldadura se sujetarán a los mismos requisitos de calidad que las soldaduras finales, salvo que :

G.1.1. No es obligatorio el precalentamiento para soldaduras de un solo paso, que se volverán a fundir e incorporarán a soldaduras de arco sumergido - continuos.

G.1.2. No es necesario remover defectos tales como socavaciones, cráteres sin rellenos y porosidades antes de colocar la soldadura final de arco sumergido.

G.2. Los puntos de soldadura que se vayan a incorporar a la soldadura final se harán con electrodos que cumplan los requisitos de las soldaduras finales, y se limpiarán cuidadosamente. Los puntos de soldadura tendrán sus extremos en cascada.

G.3. Deberán quitarse los puntos de soldadura que no se vayan a incorporar a las soldaduras finales - excepto en edificios, en los que pueden dejarse si PEMEX no solicita su remoción.

H.- Agujeros para pernos o remaches.

Los agujeros para pernos o remaches deberán ser 2 mm - mayores que el diámetro nominal del perno o remache. - Si el espesor del material no es mayor que el diámetro nominal del perno o remache más 3 mm los agujeros pueden punzonarse. Si el espesor del material es mayor que

el diámetro nominal del perno o remache más 3 mm, los agujeros deben taladrarse, o subponzonarse y rimarse. Los agujeros en placas de acero A 514 con espesores mayores que 13 mm deberán taladrarse.

#### V. TOLENCIAS DIMENSIONALES.

Las dimensiones de los miembros estructurales soldadas estarán dentro de las tolerancias de las especificaciones generales que gobiernan el trabajo, y también dentro de las siguientes tolerancias especiales.

A.- Falta de derechura de columnas soldadas y de miembros principales de armaduras, cualquiera que sea su sección transversal :

Longitudes hasta de

14.0 metros                    (Longitud total. en metros) -  
                                  x 1 mm, pero no más de 10-  
                                  mm.

Longitudes mayores de

14.0 metros                    10 mm + (Longitud total en -  
                                  metros - 14.0 ) x 1 mm.

B.- Falta de derechura de vigas o tráves soldadas de cualquier sección transversal, cuando se da una curvatura o contraflecha especificada :

( Longitud total en metros) x 1 mm.

C.- Para piezas fabricadas antes del Montaje.:

Desviación con respecto a la flecha especificada de vigas o tráves soldadas de cualquier sección transversal . :

- $\pm$  ( Longitud total, en metros ) x 0.25 mm sin exceder 20 mm ( 3/4 pulg.), o
- + 3 mm + (distancia, en metros, al extremo más cercano) x 1 mm.

Cualquiera que sea mayor, excepto en miembros cuyo patín superior esté embebido en concreto sin que se diseñe un acartelamiento de concreto, en los que la desviación, en milímetros, no debe exceder de  $\pm 1/2$  Longitud total ( en m ) o 6 mm ( 1/4 pulg.), cualquiera que sea mayor.

D.- Desviación lateral entre los ejes del alma y del patín de miembros H o I armadas, en la superficie de contacto.

6 mm ( 1/4 pulg.) máximo.

E.- La desviación respecto a un plano, de las almas de traves, se determinará midiendo los desplazamientos del alma mediante una regla cuya longitud no sera menor que la dimensión más pequeña de cualquier tablero.

E.1.- La desviación respecto a un plano de almas con altura D, y espesor T, en tableros rodeados por atiesadores v/o patines, siendo D la menor dimensión del tablero, no deberá exceder los siguientes valores :

Desviación máxima dependiendo  
del tipo de carga.

#### Atiesadores intermedios

en ambas caras del alma

Estática

Dinámica

D/t 150

d/100

d/115

D/t 150

d/80

d/92

#### Atiesadores intermedios

sólo en una cara del alma.

|                                  |     |       |
|----------------------------------|-----|-------|
| D/t                              | 100 | d/100 |
| D/t                              | 100 | d/67  |
| Sin atiesadores inter<br>medios. |     | D/150 |

E.2.- Si por motivos arquitectónicos se requieren tolerancias más restrictivas que las antes descritas se deberán mencionar en las especificaciones particulares.

F.- El alabeo e inclinación combinados del patín de vigas-o tráves soldadas se determinará midiendo el desplazamiento del borde del patín a partir de una línea normal al plano del alma, trazada por la intersección del eje del alma con la superficie exterior de la placa del patín. Este desplazamiento no debe exceder 1/100 del ancho total del patín o 6 mm ( 1/4 pulg.) cualquiera que sea mayor, excepto en las piezas que se vayan a unir con soldaduras a tope.

G.- Apoyo en los puntos de carga.

Los extremos de apoyo de atiesadores colocados bajo---cargas concentradas estaran al ras y a escuadra con el alma, y tendrán cuando menos el 75% de su área en contacto con la superficie interior de los patines. La superficie exterior de los patines, cuando se apoyen en una base o asiento de acero, deberá ajustarse con tolerancias no mayores de 0.25 mm. ( 0.01 pulg.) en el 75% del área proyectada del alma y atiesadores, y no mayores de 0.8 mm ( 1/32 pulg.) en el 25% restante del área proyectada. Los trábes sin atiesadores deberán apoyarse sobre el área del alma proyectada en la superficie externa del patín con una tolerancia no mayor de 0.25 mm ( 0.01 pulg.), y el ángulo comprendido entre el alma y el patín no excederá de 90 grados en la zona de apoyo.

H.- Ajuste de las atiesadores intermedios

Cuando se especifiquen atiesadores intermedios ajustados, se permitirá una separación hasta de 2 mm ( 1/16-pulg.) entre atiesadores y patín.

I.- Desviación respecto al peralte especificado en vigas y tráves soldadas, medida en el eje del alma, será como sigue. :

Para peraltes hasta de 91 cm.

( 36 pulg.) inclusive                     $\pm$  3 mm ( 1/8 pulg.)

Para peraltes mayores de 91 cm.

(36 pulg.) y hasta 183 cm ( 72 pulg.).                     $\pm$  5 mm ( 3/16 Pulg.)

Inclusive

Para peraltes de más de 183cm.

( 72 pulg.).                    + 18 mm ( 5/16 pulg.)  
    - 5 mm ( 3/16 pulg.)

J.- Derechura de atiesadores intermedios.

La falta de derechura de los atiesadores intermedios no excederá 13 mm ( 1/2 pulg.), tomando en cuenta cualquier miembro que se conecte en ellos.

K.- Derechura y Colocación de los atiesadores de apoyo.

La falta de derechura de los atiesadores de apoyo no excederá de 6 mm ( 1/4 pulg.) para longitudes hasta -- 183 cm. ( 6 pies) & 13 mm ( 1/2 pulg.) para longitudes mayores de 183 cm. ( 6 pies), y el eje real del atiesador deberá quedar dentro del espesor del mismo, medida desde la posición teórica del eje.

## VI. PERFILES DE LAS SOLDADURAS.

A.- Las caras de las soldaduras de filete pueden ser planas o ligeramente cóncavas o convexas, como se muestra en figura 9, a, b y c, sin defectos tales como los mostrados ind. La convexidad, c, debe cumplir.

$$C = 0.1 S + 0.75 \text{ mm.}$$

donde  $S$  es el tamaño real de la soldadura de filete, - en mm ( ver figura 9, c).

B.- Las soldaduras de penetración se harán de preferencia con refuerzo pequeño o mínimo, salvo que se prevea de otra forma. Para juntas a tope o de esquina, el refuerzo no excederá una altura de 3 mm ( 1/8 pulg.) y tendrá una transición gradual hacia la superficie del metal base ( fig. 9,c). Las soldaduras de penetración - no tendrán defectos como los que se muestran en la fig. 9, f.

C.- Las superficies de juntas a tope que se deben alisar - se terminarán de manera que no se reduzca el espesor - del metal base más delgado, o del metal de aportación es más de 0.8 mm ( 1/32 pulg.) ó 5% del espesor, el -- que sea menor, y que no deje refuerzo que exceda 0.8 - mm. ( 1/32 pulg.). Sin embargo, se quitará todo el re fuerzo cuando las soldaduras formen parte de una super ficie de contacto.

D.- En edificios y estructuras tubulares, las socavaciones no tendrán una profundidad mayor de 0.25 mm ( 0.01pulg) cuando sean transversales a los esfuerzos de tensión - primarias en la pieza socavada, ni más de 0.8 mm ----- ( 1/32 pulg.) de profundidad en cualquier otro caso.

E.- Las soldaduras no deben tener traslape.

### PERFILES DE LAS SOLDADURAS

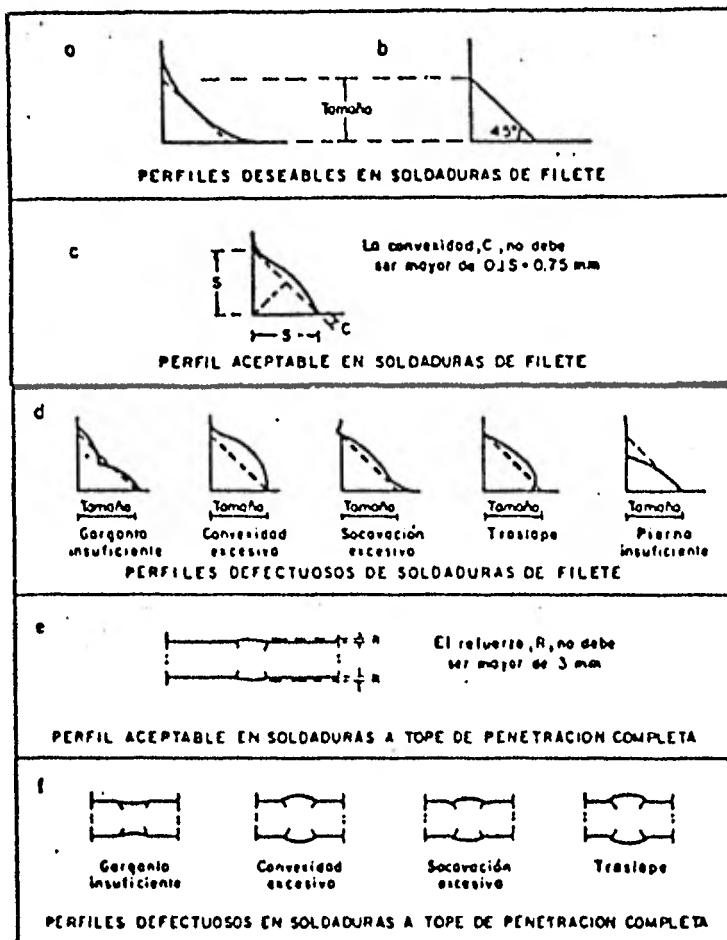

Figura 9

CORRECCIONES.

- A.- La remoción del metal de aportación o porciones del metal base puede hacerse mediante maquinado, esmerilado cincelado, corte con oxígeno o arco con electrodo de carbón y chorro de aire, de tal forma que el metal base o de aportación restante no se socave ni maltrate.- El corte con xoígeno no se utilizará en aceros templados. Las porciones defectuosas de la soldadura se quitarán sin remover parte importantes del metal base. -- Las cantidad adicionales de mtal de aportación necesarias para compensar la dificiencia de tamaño se depositarán empleando, preferiblemente, electrodos de tamaño menor que el utilizado para hacer la soldadura original de preferencia con diámetro no mayor de 14 mm. Las superficies se limpiarán cuidadosamente antes de soldar.
- B.- Las soldaduras y el metal base que estén defectuosos - o que no estén sanos se corregirán removiendo y reemplazando la soldadura completa, o como sigue :
- B.1.- Traslape o convexidad excesiva: redúzcase quitando el exceso de metal de aportación.
- B.2.- Concavidad excesiva del soldaduras o crátes, tamaño menor que el admissible, socavación: limpiece y depositese metal de aportación adicional.
- B.3.- Porosidad excesiva de la soldadura, inclusiones- excesivas de escoria, fusión incompleta: quitese las porciones defectuosas y vuelvase a soldar.
- B.4.- Grietas en la soldadura o en el metal base: determine la extensión de la grieta mediante inspección con ácido o partículas magnéticas, remuevase la grieta y el metal sano hasta 5 cm. ( 2 pulg. más allá del extremo de la grieta y vuelvase a soldar.
- C.- Los miembros deformados por la soldadura se enderezarán mecánicamente o por la aplicación, cuidadosamente-

supervisada, de cantidades limitadas de color en zonas localizadas. La temperatura de las áreas calentadas - no excederá 593°C ( 1100°F) para aceros templados ni - 649°C ( 1200°F) para otros aceros.

D.- Se deberá contar con aprobación de PEMEX para correcciones tales como reparaciones del metal base, grietas -- grandes y rediseños para compensar deficiencias.

F.- Cuando el trabajo realizado posteriormente a la ejecución de una soldadura deficiente la ha hecho inaccesible o crea nuevas condiciones que hacen que la corrección de la deficiencia sea peligrosa o ineficiente, se restarán las condiciones originales quitando soldaduras o miembros, o ambos, antes de hacer correcciones si no se hace lo anterior, la deficiencia se compensará mediante material adicional, colocado de acuerdo con un diseño revisado y aprobado.

#### VIII MARTILLEO.

Se puede usar el martilleo de capas intermedias de soldadura para controlar los esfuerzos por contracción en soldaduras gruesas, y así evitar el agrietamiento. No se martillará la raíz ni la capa superficial de soldadura, ni el metal base en los bordes de la soldadura.- Se tendrá cuidado de evitar el traslape o agrietamiento de la soldadura o metal base.

#### IX LIMPIEZA Y CAPAS PROTECTORAS.

Se limpiará la escoria de todas las soldaduras. Las juntas soldadas no se pintarán hasta que el trabajo esté terminado y aceptado. Las superficies que se vayan a pintar no tendrán salpicaderas, óxido, escamas sueltas, aceite o suciedad. La pintura estará de acuerdo con las especificaciones generales del trabajo.

## CONTRAFLECHA.

### A.- Armaduras y Trabes.

A las armaduras cuyo claro sea de 25 m o más se les dará, en general, una contraflecha aproximadamente igual a la flecha producida por la carga muerta. A las trabes carril de 23m de claro o más se les dará, en general, una contraflecha aproximadamente igual a la flecha producida por la carga muerta más la mitad de la - carga viva.

### B.- Contraflecha de otros elementos.

Si son necesarios requisitos especiales de contraflecha para lograr que una pieza cargada ajuste con otros elementos, esos requisitos deberán señalarse en los -- planos y dibujos de detalle.

### C.- Montaje.

Las vigas y armaduras que se detallen sin especificar contraflecha se fabricarán de manera que, después del montaje, cualquier contraflecha pequeña debida al laminado o ensamble en el taller, quede hacia arriba. Si la contraflecha implica el montaje de algún miembro sometido a una fuerza determinada, esto deberá indicarse en el diagrama de montaje.

### D.- Contraflecha, Enderezado o formas curvas.

Para introducir o corregir contraflechas, para enderezar o para dar una forma curva al material, puede aplicarse calor localmente o utilizarse medios mecánicos. - La temperatura de las áreas calentadas, medida con métodos aprobados, no debe exceder 593°C (1100°F) para acero A 514, & 649°C (1200°F) para otros aceros.

I      CONSTRUCCION CON PERNOS O REMACHES DE ALTA RESISTENCIA.

Ensamblado.

A.- Durante la colocación de los remaches, todas las partes de miembros remachados se mantendrán unidas entre sí -- rígidamente, por medio de pasadores o tornillos.

Los agujeros que deben agrandarse para admitir remaches o pernos se rimarán posteriormente. La mala coincidencia de los agujeros será motivo de rechazo de la pieza. Los remaches se colocarán con máquina, ya sea del tipo de compresión y operada manualmente, de tipo neumático, hidráulico o eléctrico.

El remachado se hará, generalmente, en caliente, los remaches se calentarán uniformemente a una temperatura que no exceda 1066°C ( 1950°F), y no menor de 538°C ( 1000 °F).

B.- Las superficies de piezas unidas con pernos de alta resistencia, que estén en contacto con la cabeza o la tuerca, no tendrán una pendiente mayor que 1:20 con respecto a un plano normal al eje del perno; cuando la pendiente sea mayor, se usará una rondana biselada para compensar la falta de paralelismo.

Todos los pernos tipo A 325, A 449 y A 490 se apretarán hasta obtener una tensión inicial no menor que la dada en la Tabla 1. Esto se logrará con el método de " vuelta a la tuerca", o por medio de llaves calibradas adecuadamente.

XII      CONSTRUCCION SOLDADA.

En todas las soldaduras de penetración completa hechas manualmente, salvo cuando se hagan empleando placa de respaldo o en posición plana, desde ambos lados, en material con borde recto, de grueso no mayor de 8 mm y con abertura en la raíz no menor de la mitad del grueso de la parte unida más delgada, deberá quitarse la raíz del primer cordón.

Antes de depositar la soldadura, el metal base precalentará de acuerdo con la tabla 2. Cuando un metal base que no requiera precalentamiento se encuentre a una temperatura menor de 0°C ( 32°F), se precalentará por lo menos a 21°C ( 70°F), antes de puntearlo o soldarlo.

Cuando se requiera, las capas intermedias de soldaduras de pasos múltiples pueden martillarse con golpes ligeros de martillo mecánico con punta redondeada. El martilleo debe realizarse cuando la soldadura esté tibia al tacto. Se tendrá cuidado para evitar que la soldadura o el metal base se dañen por exceso de martilleo.

| Tamaño del perno<br>(mm) (pulg) | Tensión mínima en el perno, * ton |             |
|---------------------------------|-----------------------------------|-------------|
|                                 | Pernos A325 y<br>A449             | Pernos A490 |
| 12.7 (1/2)                      | 5.4                               | 6.8         |
| 15.9 (5/8)                      | 8.6                               | 10.9        |
| 19.1 (3/4)                      | 12.7                              | 15.9        |
| 22.2 (7/8)                      | 17.7                              | 22.2        |
| 25.4 (1 )                       | 23.1                              | 29.0        |
| 28.6 (1 1/8)                    | 25.4                              | 36.3        |
| 31.8 (1 1/4)                    | 32.2                              | 46.3        |
| 34.9 (1 5/8)                    | 38.6                              | 54.9        |
| 38.1 (1 1/2)                    | 46.7                              | 67.1        |
| Sobre 38.1                      |                                   | 0.7 x RT    |

\* Igual al 70 por ciento de la resistencia a la tensión (RT) mínima de los pernos.

TABLA 1.

TABLA 2.

| TEMPERATURA MINIMA DE PRECALENTAMIENTO Y DE ENTREPASO, °C*    |   |  |  |   |     |
|---|---|--|--|---|-----|
| Espesor de la parte más gruesa en el punto que se suelda (mm) | Soldadura de arco con electrodos recubiertos, que no son de bajo contenido de hidrógeno | Soldadura de arco con electrodos recubiertos de bajo contenido de hidrógeno; soldadura con arco sumergido; soldadura de arco con electrodo y gas | Soldadura de arco con electrodos recubiertos, de bajo contenido de hidrógeno; soldadura con arco sumergido con alambre de acero al carbono o de aleación y fundente neutral; soldadura de arco con electrodo y gas | Soldadura con arco sumergido con alambre de acero al carbono y fundente de aleación |     |
|   | ASTM A36; A53 Grado B; A375; A500; A501; A579; A570 Grados D y E                        | ASTM A36; A242 Grado soldable; A375; A441; A529; A570 Grados D y E; A572 Grados 48, 45 y 50; A588  | ASTM A572 Grados 55, 60 y 65   | ASTM A514   |     |
| Hasta 19.1, incl.   | Ninguna**   | Ninguna**  | 20   | 10  | 10  |
| Sobre 19.1 hasta 38.1 incl.                                   | 65  | 20**   | 65   | 50  | 95  |
| Sobre 38.1 hasta 63.5 incl.                                   | 105   | 65**   | 105  | 80  | 150 |
| Sobre 63.5  | 150   | 105  | 150  | 105   | 205 |

\* No debe soldarse cuando la temperatura ambiente sea menor que  $-18^{\circ}\text{C}$ . Cuando el metal base esté a una temperatura por abajo de las de la lista, para el proceso de soldadura empleado y un espesor dado del material, se deberá precalentar (salvo que se diga de otra forma) de manera que la superficie de las piezas sobre las que se van a soldar esté a la temperatura mínima especificada, o arriba de ella, hasta una distancia igual al espesor de la pieza que se vaya a soldar, pero no menor de 76 mm (3 pulg), en dirección lateral y en la de avance de la soldadura. Las temperaturas de precalentamiento y de entrepaso serán tales que eviten la formación de grietas. Para soldaduras que están muy restringidas pueden necesitarse temperaturas por arriba de los mínimos mostrados. Para acero A514 las temperaturas máximas de precalentamiento y de entrepaso no deben exceder  $205^{\circ}\text{C}$  para espesores hasta de 38 mm ( $1\frac{1}{2}$  pulg) inclusive, y  $230^{\circ}\text{C}$  para espesores mayores.

\*\* Cuando la temperatura del metal base esté por abajo de  $0^{\circ}\text{C}$ , se precalentará el metal base hasta  $20^{\circ}\text{C}$ , por lo menos, y se mantendrá a esta temperatura mínima durante la soldadura.

\* Esta provisión también se aplica para acero A36, con espesor hasta 25 mm (1 pulg).

\*\* El precalentamiento mínimo para acero A36, con espesor hasta 51 mm (2 pulg), será de  $10^{\circ}\text{C}$ .

TOLERANCIA.-

## A.- Derechura.

Los miembros estructurales que consistan primordialmente en una sola pieza laminada deberán, a menos que se especifique otra cosa, estar derechos dentro de las tolerancias permitidas por la especificación ASMT-A6. Los miembros estructurales compuestos, remachados o soldados, deberán estar, salvo que se especifique otra cosa, dentro de las tolerancias permitidas para secciones H por la especificación ASTM-A6. Los miembros comprimidos no se desviará de la línea recta más de 1/100 de la distancia entre puntos que vayan a estar soportados lateralmente. Los miembros terminados no estarán torcidos, doblados o conjuntos abiertos; se rechazará el material que presente dobleces bruscos.

## B.- Longitud.

Se permite una variación de 1mm en la longitud total de miembros con ambos extremos preparados para transmitir compresiones por contacto directo.

Los miembros que no tengan sus extremos preparados para trabajar por contacto directo y que vayan a armarse con otras piezas de acero de la estructura, pueden tener una variación con respecto a su longitud detallada no mayor de 2 mm para longitudes de hasta 9 m. y no mayor de 3 mm para más de 9 m. de largo.

## C.- Tolerancias en el Montaje.

C.1.- En el montaje de piezas de acero se considera -- que estas están a plomo, a nivel y alineadas si la tangente del ángulo que forma la recta que une los extremos de la pieza con el eje de proyección no excede 1:500

C.2.- En el montaje de piezas para estructuras de varios pisos, se considera que estas están a plomo, a nivel y alineadas si la tangente del ángulo -- que forma la recta que une los extremos de la pie-

za con el eje de proyecto no excede 1:500, siempre que :

C.2.1.- El desplazamiento de los ejes de columnas adyacentes a cubos de elevador, respecto de su eje teórico, no excede 25mm en --- cualquier punto de los primeros 20 pisos Sobre este nivel, el desplazamiento puede aumentar 1 mm por cada piso adicional hasta un desplazamiento máximo de 50 mm.

C.2.2.- El desplazamiento de los ejes de columnas exteriores, respecto de su eje teórico, no es mayor de 25 mm hacia afuera, ni -- 50 mm hacia dentro del paño del edificio en cualquier punto de los primeros 20 pisos. Sobre este nivel, estos límites pueden aumentarse 1.5 mm por cada piso adicional, pero sin exceder un desplazamiento total de 50 mm. hacia afuera, ni- 75 mm hacia dentro del paño del edificio.

#### XIV CONTROL DE CALIDAD.

##### A.- General.

El fabricante efectuará el control de calidad que juzgue necesario para asegurar que todo el trabajo se realice de acuerdo con esta norma. Además, tanto el material como la mano de obra pueden ser inspeccionados en cualquier etapa del proceso de fabricación por inspectores calificados que representen a PEMEX hasta donde sea posible, toda la inspección por parte de PEMEX se hará en la planta del fabricante, y este cooperará con el inspector, permitiéndole el acceso todos los lugares donde se esté haciendo el trabajo.

##### B.- Rechazos.

Pueden rechazarse en cualquier momento, durante el --- avance del trabajo, material o mano de obra que no estén razonablemente de acuerdo con esta especificación.

C.- Inspección de la Soldadura.

La inspección de la soldadura se realizará de acuerdo con a sección 6 del Structural Welding Code del AWS. - Cuando se requieran pruebas no destructivas, se definirán claramente proceso, extensión, técnicas y reglas - de aceptación.

D.- Identificación del Acero de alta Resistencia.

El acero que se use para piezas principales y que se requiera que tenga un esfuerzo de fluencia superior a 2 530 kg/cm<sup>2</sup> ( 36 ksi) se marcará en el taller del fabricante de manera que se pueda identificar su especificación ASTM.

XV

PINTURA DE TALLER

A.- Requisitos Generales.

No sé deben pintar las estructuras que vayan a recubrirse con concreto. En todos los casos restantes, y salvo excepción expresa, deberá darse a las estructuras una mano de pintura de taller aplicada cuidadosa y uniformemente a superficies secas que hayan sido limpiadas; la pintura puede aplicarse con brocha, rociado, rodillo, por inmersión, etc.

Después de la inspección y aprobación, pero antes de dejar el taller, todas las piezas que deban pintarse se limpiarán mediante un cepillado a mano con cepillo de cerda metálica o por otros métodos elegidos por el fabricante, para suprimir las escamas de laminación sueltas, óxido, escoria de soldadura o depósito de fundente, suciedad y cualquier materia extraña; los depósitos de grasa y aceite se removerán con un solvente. Despues de la fabricación, las estructuras que no deben pintarse en taller se limpiarán con un solvente para eliminar aceite y grasa, y la suciedad y demás materias extrañas se suprimirán mediante un cepillado cuidadoso con cepillo de fibra.

B.- Superficies Terminadas.

Las superficies terminadas con máquina deben protegerse contra la corrosión mediante una capa antioxidante que se pueda remover fácilmente antes del montaje, o que -- tenga características que hagan innecesaria su remoción.

XVI. MONTAJE.

A.- Contraventeo.

La estructura de edificios de acero se construirá a plomo y a nivel, y se colocará contraventeo temporal cuando sea necesario para tomar en cuenta todas las cargas a que puede quedar sometida durante el montaje, incluyendo el equipo y su operación. El contraventeo permanecerá en su lugar mientras la seguridad lo requiera.

B.- Conexiones Provisionales.

Durante el montaje, todas las piezas deben asegurarse mediante pernos y soldadura, para tomar en cuenta los esfuerzos producidos por carga muerta, viento, sismo y operaciones de montaje.

C.- No se colocarán remaches ni pernos o soldadura definitivas hasta que toda la zona de la estructura que vaya a quedar rigidizada por ellos esté adecuadamente alineada y plomeada.

XVII REFUERZO, REPARACION O MODIFICACION DE ESTRUCTURAS EXISTENTES.

A.- Aspectos Generales.

Todas las provisiones de esta especificación se aplican también al refuerzo, reparación o modificación de estructuras existentes, salvo cuando los afecte alguna de las siguientes cláusulas.

A.1.1.- Antes de preparar los dibujos y especificaciones

relativos al refuerzo, reparación o modificación de una estructura existente, se determinarán las características del metal base empleado en ella.

A.1.2.- Cuando se vayan a soldar entre sí aceros de distintas propiedades, se prestará especial atención a la selección de metal de aportación y del procedimiento de soldadura que se empleará para depositarlo.

B.- Diseño.

B.1.- Antes de diseñar las reparaciones o refuerzos de las estructuras existentes, deben determinarse los siguientes puntos.

B.1.a.- El carácter y extensión de los daños de las piezas y conexiones que requieran reparación o refuerzo.

B.1.b.- Si las reparaciones consistirán sólo en reponer las partes corroídas o dañadas, o remplazar miembros completos.

B.2.- Al diseñar un refuerzo que vaya más allá de reposicionar los miembros corroídos o dañados se hará un estudio completo de las condiciones de estabilidad en que se encuentra la estructura. Si está sometida a cargas repetidas se tomará en cuenta el efecto, sobre su resistencia a la fatiga, de los ciclos de carga que haya soportado antes de la reparación.

B.3.- Si la estructura está sometida a cargas repetidas,

los detalles del refuerzo se harán tomando en cuenta el efecto debilitante que tienen las concentraciones de esfuerzo en la resistencia a la fatiga - del metal base.

B.4.- Consideraciones Especiales.

B.4.a.- Antes de efectuar cualquier operación de - refuerzo, reparación o modificación de una estructura existente, será necesario determinar si se permite o no, que los miembros que la forman soporten carga viva mientras se realizan en ellos operaciones de soldado o de corte, teniendo en cuenta la extensión de la zona de la sección transversal del miembro que se afectará por el calentamiento resultante.

B.4.b.- Si se añade material a un miembro que soporta cargas que produzcan esfuerzos de -- 200 kg/cm<sup>2</sup> o mayores ya sea para reparar - porciones corroídas o para reforzarlo, es conveniente descargar el miembro o presforzar el material agregado. Si no es factible ninguna de esas operaciones, el material adicional se proporcionará de forma que quede sometido a un esfuerzo igual al esfuerzo permisible en el miembro original menos el esfuerzo que origina en él las -- cargas existentes.

Los remaches y pernos de alta resistencia-existentes en la estructural original se - pueden usar para tomar las cargas muertas- de la estrucutra reparada reforzada o modificada, de manera que la soldadura adicional se puede proporcionar para soportarn - únicamente las cargas restantes. Sin embargo, si la capacidad de los remaches o -

pernos existentes es menor que la necesaria para soportar la carga muerta, la soldadura adicional se dimensionará para tomar la totalidad de la carga ( muerta, viva y accidental.).

Al agregar material para reforzar un elemento estructural es recomendable planear el orden en que se efectuarán las soldaduras, de forma que se mantenga siempre una sección transversal simétrica. Este requisito es de particular importancia cuando se permite que la carga via siga obrando sobre la estructura durante el refuerzo o reparación.

#### 4.- Secuencia del Procedimiento Constructivo

La secuencia constructiva ó de fábricación se encuentra intimamente relacionada con la secuencia de montaje, esto es, con el fin de evitar el almacenaje de las piezas, por lo tanto -- conviene que conforme se van fabricando se van montando.

Debido a la simetría que poseen algunos niveles, nos facilita en estos casos el poder fabricar algunas piezas en serie, lo cual permite montar el edificio en un tiempo mas corto.

Analizando lo anterior podemos deducir la siguiente secuencia de fabricación.

#### EDIFICIO "A"

##### Columnas

| Partida | Cantidad | Descripción | Peso pieza | Peso total |
|---------|----------|-------------|------------|------------|
| 1       | 1        | K3-31-31'c  | 9,020.30   | 9,020.30   |

## 5.- RECURSOS DE MANO DE OBRA, MATERIALES Y EQUIPO

### MANO DE OBRA

Para la fabricación de la estructura, se cuenta con una planta propia en la cual se tiene la M. de O. capacitada y con experiencia en este tipo de obra.

Para el montaje se contara con el siguiente personal

#### Personal Técnico y Administrativo

Superintendente

ING. Frente soldadura

ING. Frente montaje

ING. Estimaciones

Administrador

Contador

Topografo

Cadenero

Jefe de personal

Auxiliar

Tomador de tiempo

Almacenista

Kardista

Secretaria

Dibujante

#### Personal Obrero

Cuadrilla tipo

Cabo de oficios 1

Op. Esp. Maniobrista 1

Op. Esp. Montador 5

Soldador Esp. 3

Ayte. Esp. 10

Obrero Gral. 7

### Materiales

Para la fabricación de la estructura se empleara acero tipo A-36 el cual es el de mayor consumo en México, por lo tanto hay que elaborar un programa en el cual se contemplen los envíos mensuales

|       |         |
|-------|---------|
| mes 1 | 280 ton |
| mes 2 | 400 ton |
| mes 3 | 650 ton |
| mes 4 | 800 ton |
| mes 5 | 800 ton |
| mes 6 | 720 ton |
| mes 7 | 650 ton |

Otros elementos que podemos clasificarlos dentro de materiales

|                        |     |
|------------------------|-----|
| Guantes largos (pares) | 50  |
| Guantes cortos "       | 100 |
| Mangas p/soldador      | 50  |
| Petos "                | 50  |
| Vidrios oscuros No. 11 | 25  |
| Vidrios " No. 12       | 25  |

### Equipo y Herramientas

Para la fabricación de la estructura se cuenta con soldadoras en la planta, ademas con grúas de 25 y 50 ton de capacidad para depositar la estructura sobre plataformas propias y/o alquiladas. Para el montaje la empresa cuenta con grúas de 25 ton, 50 ton, 100 ton, 150 ton y 250 ton para todo tipo de necesidades, ademas cuenta con soldadoras de 400 y 300 amp.

Otras herramientas necesarias para las diferentes categorías de personal

|         |                                  |
|---------|----------------------------------|
| Armador | 1 Plexometro de 3 mts.           |
|         | 1 Escuadra de 24"                |
|         | 1 Nivel de gota 24"              |
|         | 1 Martillo de boca de 2 1/2 lbs. |
|         | 1 Careta de maroma para soldar   |

|                |   |
|----------------|---|
| Soldador       | 1 Careta de maroma para soldar<br>1 Martillo de boca de 2 1/2 lbs<br>1 Cincel de 10" x 1"<br>1 Cepillo de alambre de cabo (tipo soldador) |
| Montador       | 1 Flexometro de 3 mts.<br>1 Escuadra de 24"<br>1 Nivel de gota de 24"<br>1 Martillo de 2 1/2 lbs.<br>1 Careta de maroma para soldador     |
| Para uso común | 3 Cintas metricas de 30 mts.<br>4 Marros de 12 lbs<br>6 Marros de 8 lbs   |

ANALISIS  
DE PRECIO  
UNITARIO

FABRICACION Y MONTAJE DE ESTRUCTURA METALICA CON PERFILES A UNA ALTURA DE 30 A MAS INCLUYE: SELECCION CARGA, TRANSPORTE, DESCARGA, CONCEPTO Y ESTIBA EN EL TALLER DE FABRICACION, PLANOS DE TALLER, - FABRICACION DE HERRAJES NECESARIOS PARA EL ARMADO EN TALLER, TRAZO CONTE Y TALADORES, ENDEREZADO DE PLACA Y PERFILES, MANEJO PRESEN TACION Y ALINEACION, NIVELACION, SOLDADURA DE ELEMENTOS QUE FORMAN LA ESTRUCTURA, RETIRO DE REFUERZOS ESMERILADO, LIMPIEZA PINTURA DE TALLER, SELECCION CARGA, TRANSPORTE, DESCARGA EN SITIO DE OBRA ACARREO AL SITIO DE ESTIBA, COLOCACION DE ANDAMIOS, ELEV. DE LAS PZAS DE ARMADO, BROQUELADO.

RREG. AL SITIO DE ESTERIL, COLOCACION DE ANAMIAS, EBBY. DE MAS  
UNIDAD TUN. ARAMDO TROQUELADO.

7.- Establecimiento de áreas internas y caminos de acceso  
El terreno en el cual se construira el edificio, es grandicimo con respecto a la obra, solo en una de sus 4 limites esta muy cerca de los edificios, pero en lo demas no se tiene ningun problema para intalar las casetas para oficinas, almacen, areas destinadas a la descarga de las estructuras y areas para el almacenamiento de las gruas y para maniobras de las mismas

En lo referente a los caminos de acceso se tomaran en cuenta -- las areas destinadas a maniobras de las grúas para que la grúa pueda desplazarse, tambien darle acceso a los vehículos de la entrada a los almacenes y a las oficinas.

## 8.-Secuencia de Montaje

El método que se escogerá dependerá de la rapidez que se requiera, del equipo requerido y el que se puede suministrar, si es -- propio, si se comprará o se rentara. También depende de las condiciones del terreno.

Se considerarán las condiciones del terreno ya que éste nos determinara si se usan grúas, derricks, viajeras u otro tipo de -- equipo.

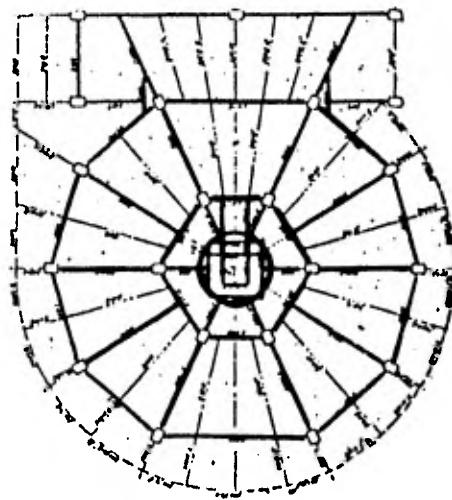

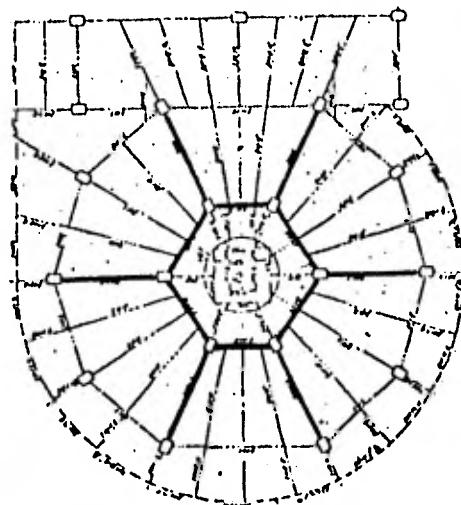

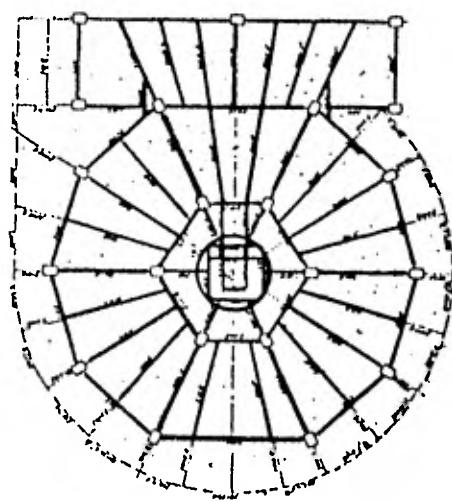

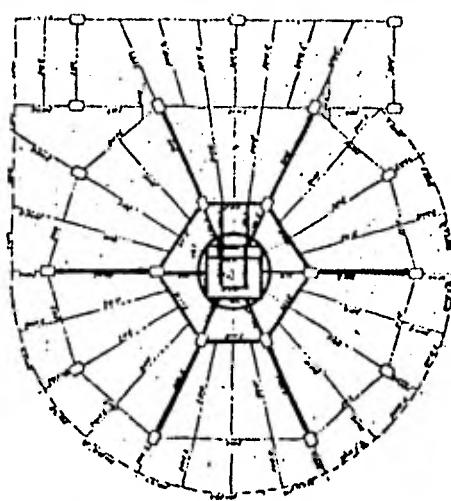

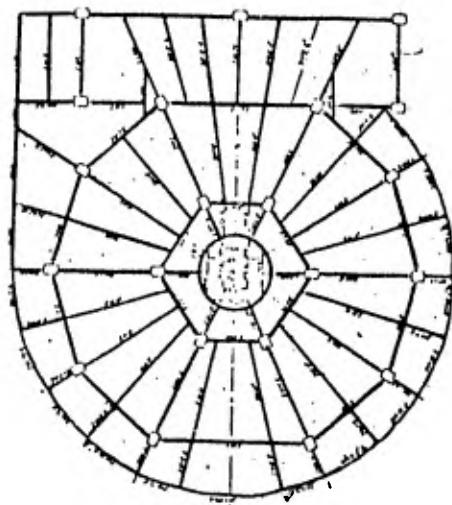

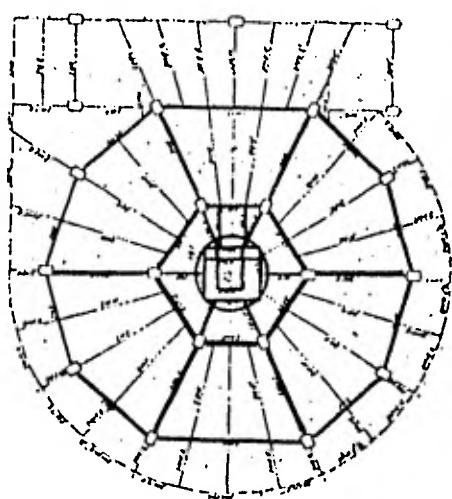

El terreno en el cual se encuentra la obra es un lugar muy amplio en el cual no se tiene problemas de espacio con lo cual se puede montar con cualquier equipo.

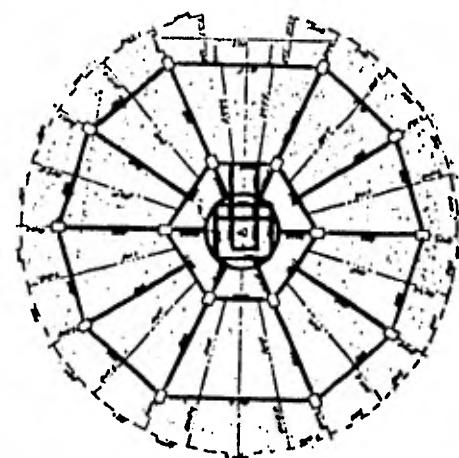

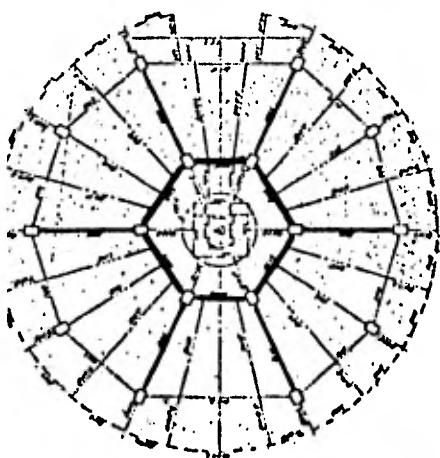

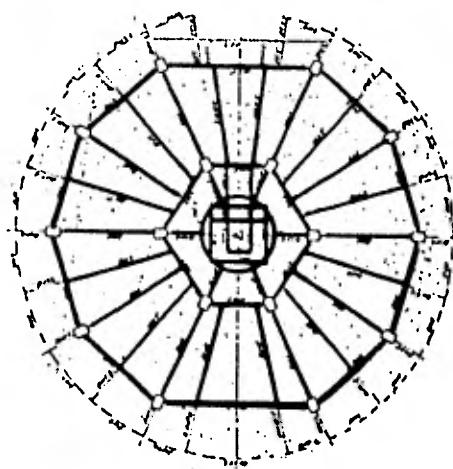

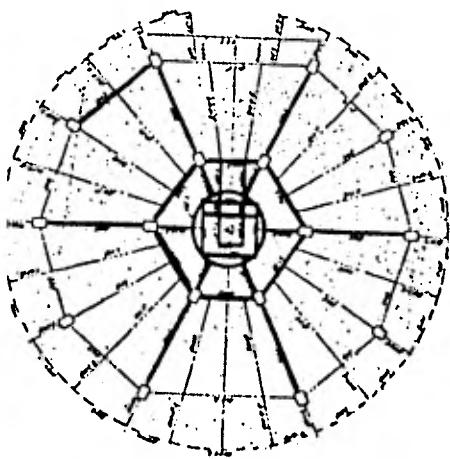

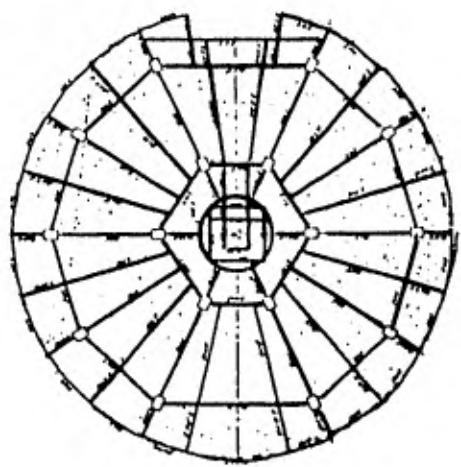

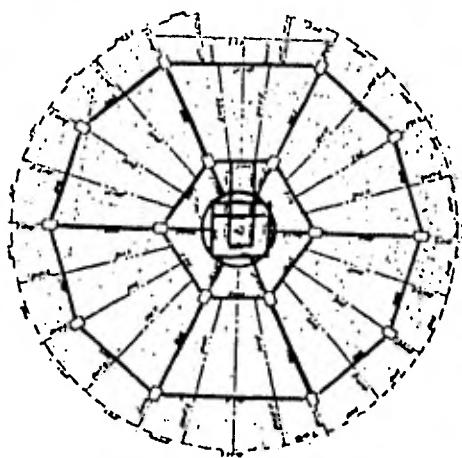

Por la forma de la estructura, no se puede usar 1 grúa viajera - serían 2, esto es porque la grúa no quedaría dentro de la estructura como es lo común sino que quedaría fuera y necesitaría un braso de 32 mts para una carga de 10 u 12 tons y una altura de - 65 mts, sería una grúa enorme y no sería costeable. La idea es - utilizar 1 grúa sobre orugas la cual obtendremos sus características. Como el edificio que mayor grado de dificultad representa es el "A" , tomaremos primero este, para los otros el grado de - dificultad es menor pero hay que tomar en cuenta el conjunto de de todos no aislados.

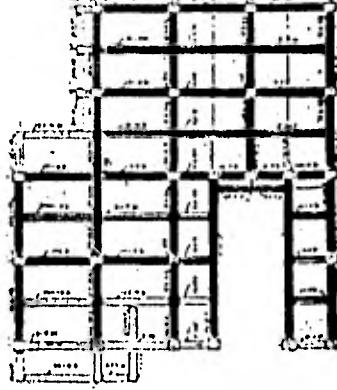

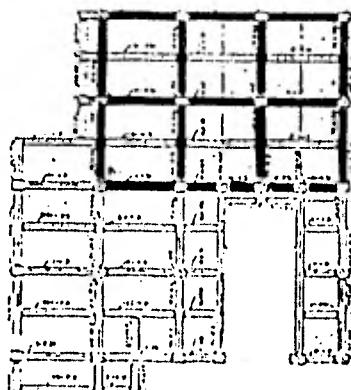

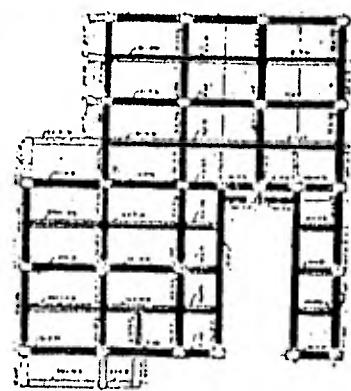

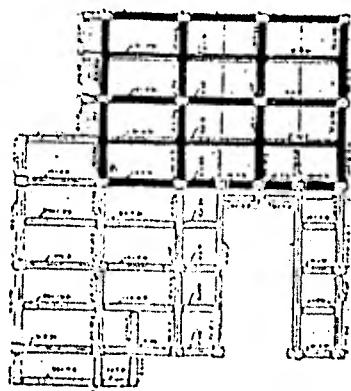

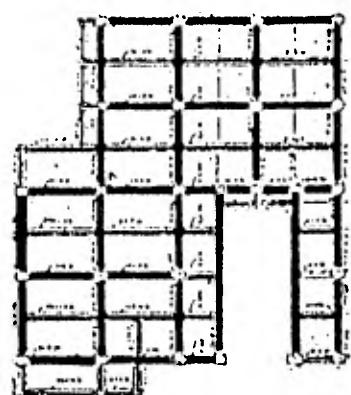

Como el edificio "A" es mayor el tiempo que emplearemos en montarlo empezaremos con este, al empezar a montarlo no tenemos el problema de que nos estorbe otro de los edificios, por lo tanto es un poco más rápido al principio, estando por empezar el cuarto nivel empezamos a montar el edificio "C", por lo tanto ya tendremos un poco más de dificultad, por lo cual cambiarán las características de la grúa tal vez, por lo cual usariamos la primera para montar "C" y cambiamos de grúa en "A".

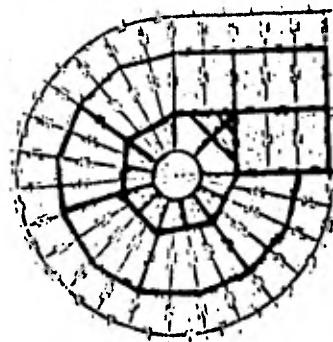

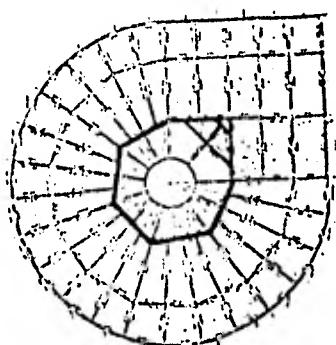

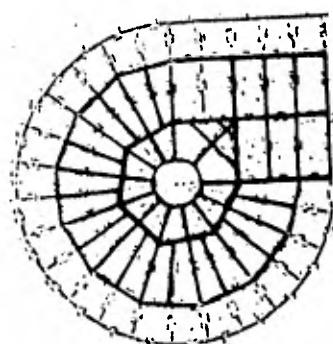

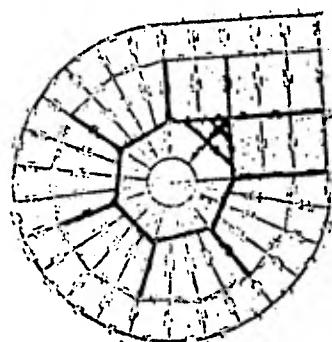

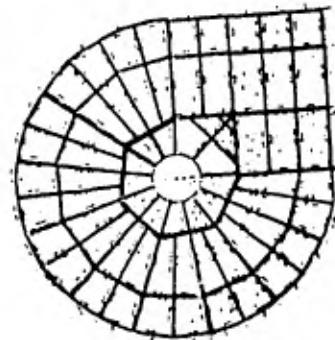

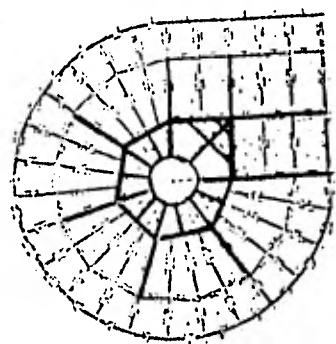

Al estar montando el edificio no es necesario que la grúa este sosteniendo la pieza ya que las columnas y traves principales tienen sus apoyos, con esto se deja la pieza y la grúa puede ir por otra mientras se suelda la primera y así sucesivamente.

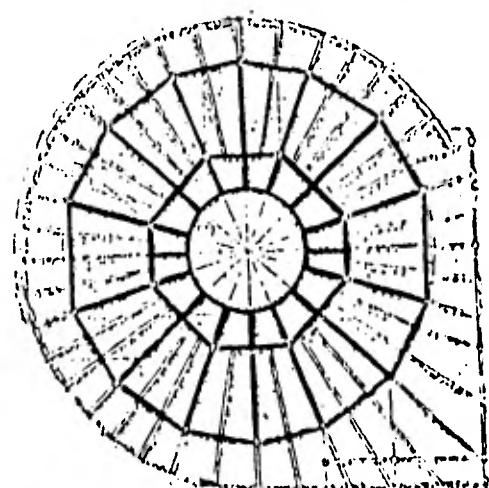

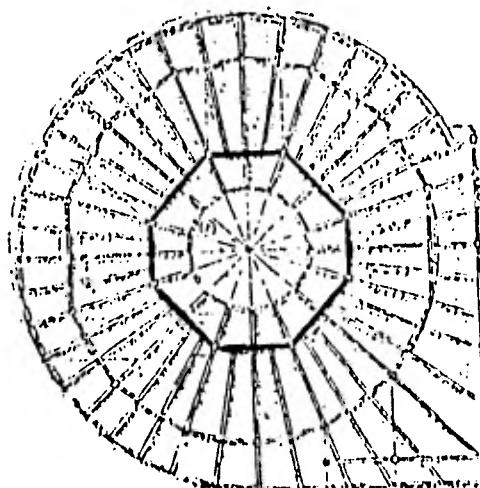

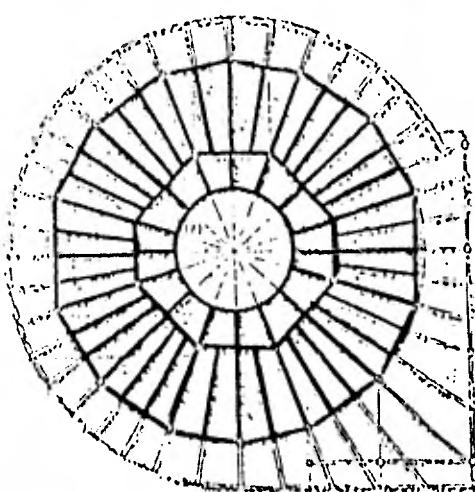

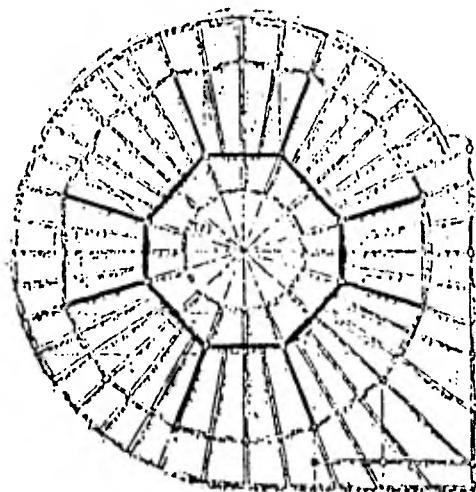

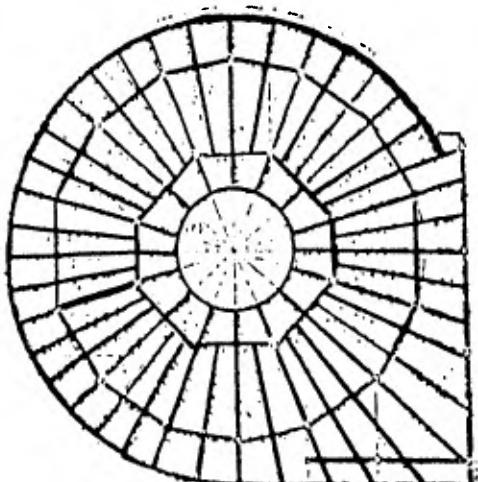

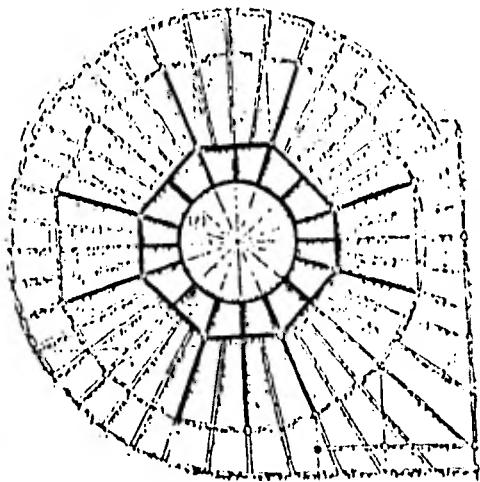

La unica parte en que es necesario sostener las piezas es en la periferia de todos los edificios, en el que tendriamos un costo mayor es en el edificio "A" ya que por la altura necesitarian - una grúa grande para la cantidad de obra que tiene cada trabe - de la periferia, sería mas conveniente instalar un malacate en - la parte superior con lo cual se abatiran costos por eso es que en la secuencia de fabricación aparecen los volados al final -- de todo el montaje en el edificio "A" por lo que se ve que en - la secuencia de fabricación entra la secuencia de montaje. En - los otros edificios no hay problemas ya que son de 2 o 3 niveles y se usara una grua pequeña.

## Link-Belt® HTC-50 lifting crane capacities

PCSA Class 10-178  
Refer to Notes page 6

### 10' (3 meter) carrier

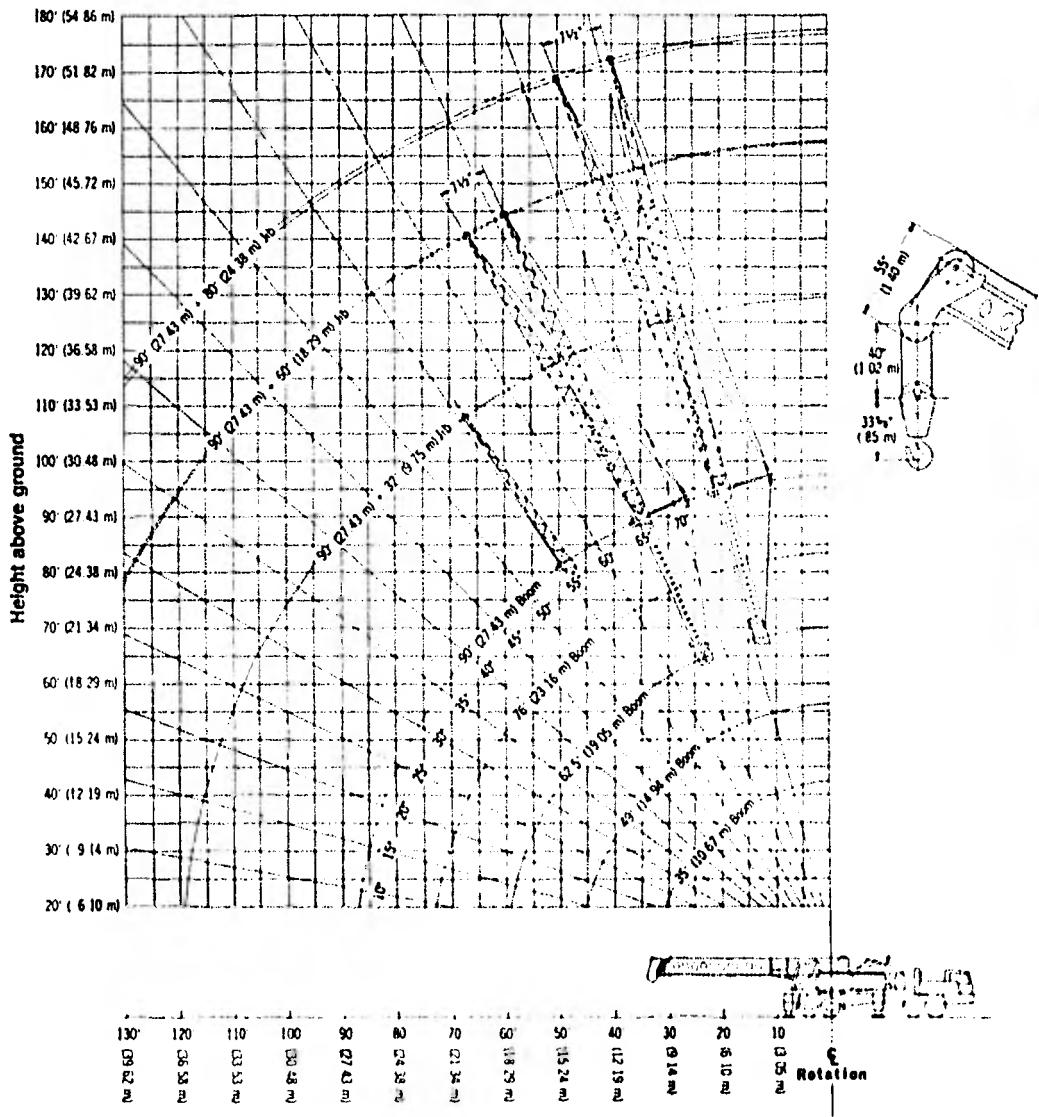

**Boom** — Three-section power boom;  
35'-90' (10.67-27.43 m) length.

**Jibs** — 32' (9.75 m) two-piece, 60'  
(18.29 m) three-piece, or 80' (24.38 m)  
four-piece.

**Carrier** — FMC 8 x 4 drive, 230°  
(58.4 m) wheelbase.

**Counterweights** — 7,700' (3,493 kg)  
on 1-drum machine; 6,700' (2,994 kg) on  
2-drum machine

<sup>D</sup> Capacities applicable to all main boom lengths and boom angles. Machine travel limited to zero to 10 m/p.h. (0-1.6 km/hr) on smooth level surface.

<sup>E</sup> Measured from center of boom head sheave to ground.

Measured from center of jib peak sheave to ground.

## Link-Belt® HC-108C lifting crane capacities

PCSA Class 10-252

Refer to Notes Page 2

**Boom — angle:** 34° x 34° (.86 x .86 m)  
with open throat top section, retractable  
high gantry, 1½" (31.75 mm) dia. boom  
pendants.

**Carrier — C.C.C. 8 x 4 drive, 224"**  
(5.69 m) wheelbase, 10' 4" (3.15 m) wide

**Counterweights — Upper ctwt. "AB"**  
18,400# (8,346 kg) or 19,200# (8,709 kg)  
— depending on upper engine used.  
Bumper ctwt., 1,640# (744 kg)

<sup>(1)</sup> Measured from center of boom head sheave to ground — machine standing on tires

(Continued)

## Notes — lifting crane capacities

1. Capacities included in this chart are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
2. Capacities are not more than 85% of minimum tipping loads unless marked with an asterisk.
3. Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, inflation of tires, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of jib, hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
4. Retractable high gantry must be fixed in raised position for all capacities on this chart.
5. Least stable rated condition is over the side.
6. Main boom length must not exceed 100' (30.48 m). Maximum jib length permitted — 40' (12.19 m); maximum boom/jib combination length permitted — 100' (30.48 m) plus 40' (12.19 m).
7. When swinging rated load from end of carrier to side of carrier, allowance must be made for any carrier deflection which will cause load radius to increase.
8. For lifting 100,000# (45,360 kg), 6-part load hoist line (4" — 10.05 mm, Type "N" wire rope) is required. Check parts of line required for all capacities.
9. To determine capacities for intermediate boom lengths not shown on this chart, use the capacity for the next longer boom length shown — for actual angle or radius at which boom/load are being worked.
10. These capacities apply only to the machine as originally manufactured and normally equipped by FMC Corporation, Crane and Excavator Division.

**Boom** — angle; 34° x 34° (.86 x .86 m) with open throat top section, retractable high gantry, 1½" (31.75 mm) dia. boom pendants.

**Jib** — angle, 23° x 18° (.58 x .46 m).

**Counterweight** — Upper cwt., "AB", 18,400# (8,346 kg) or 19,200# (8,709 kg)  
— depending on upper engine used  
Bumper cwt., 1,640# (744 kg)

Maximum boom and boom/jib machine can lift off<sup>①</sup> ground unassisted — without load.

| Standard machine equipped with counterweights above. | On Outriggers |        |            |         | On Tires |        |            |               |

| Over Side  | 100      | 30.48  | 80 + 40    | 24.38 + 12.19 |

Based on 85% of stability.

© Hook blocks on ground and machine standing level on firm supporting surface.

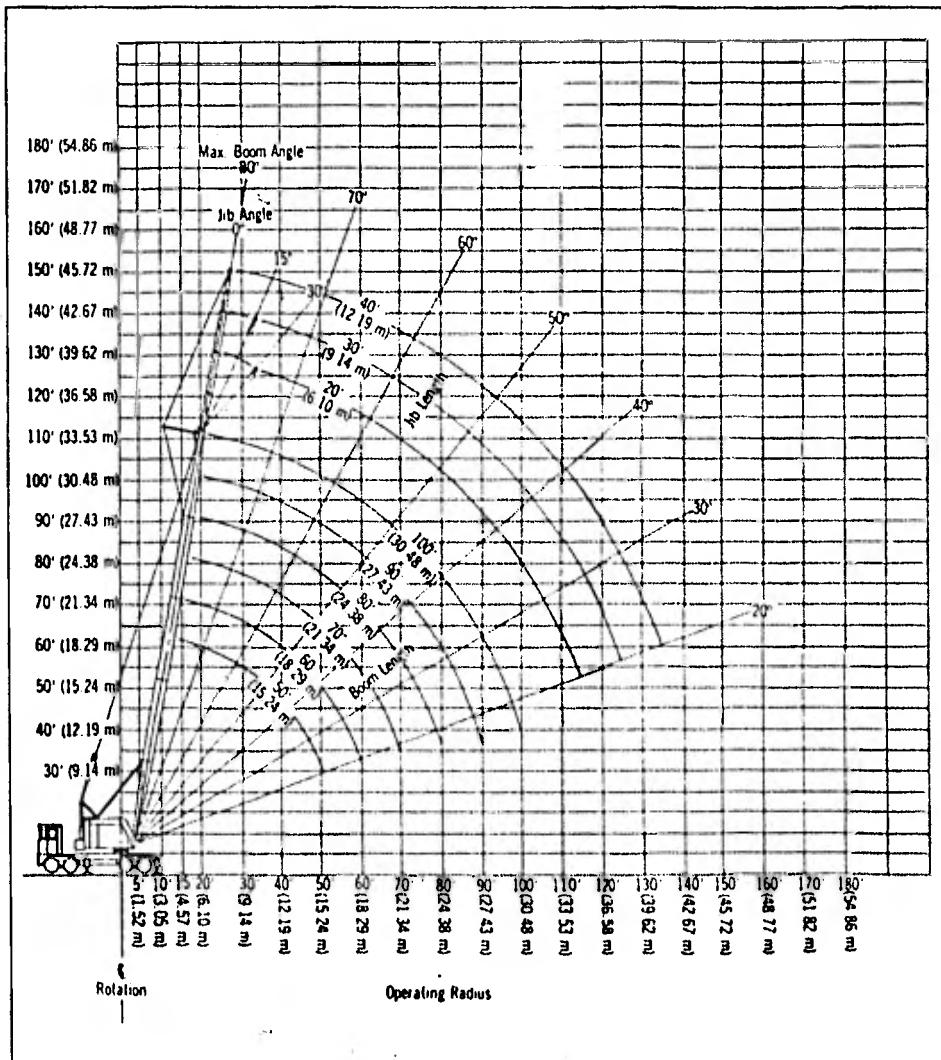

© Based on firm, level supporting surface.

© Equipped with 50-ton (45.35 mton), 525# (238 kgs) hook block and 8½-ton (7.71 mton), 170# (77 kgs) swivel hook with weighted ball — carried at boom and jib points.

## HC-108C boom/jib working ranges

**Boom — angle:**  $34^\circ \times 34^\circ$  (86 x 86 m) with Jib — angle:  $23^\circ \times 18^\circ$  (58 x 46 m).  
 open throat top section, retractable high  
 gantry,  $1\frac{1}{2}''$  (31.75 mm) dia. boom pendants;  
 boom live mast and boom midpoint,  
 suspension pendants as required.

**Counterweights —** Upper cwt. "AB",  
 18,400 lb (8,346 kg) or 19,200 lb (8,709 kg)  
 — depending on upper engine used.  
 Bumper cwt., 1,640 lb (744 kg).

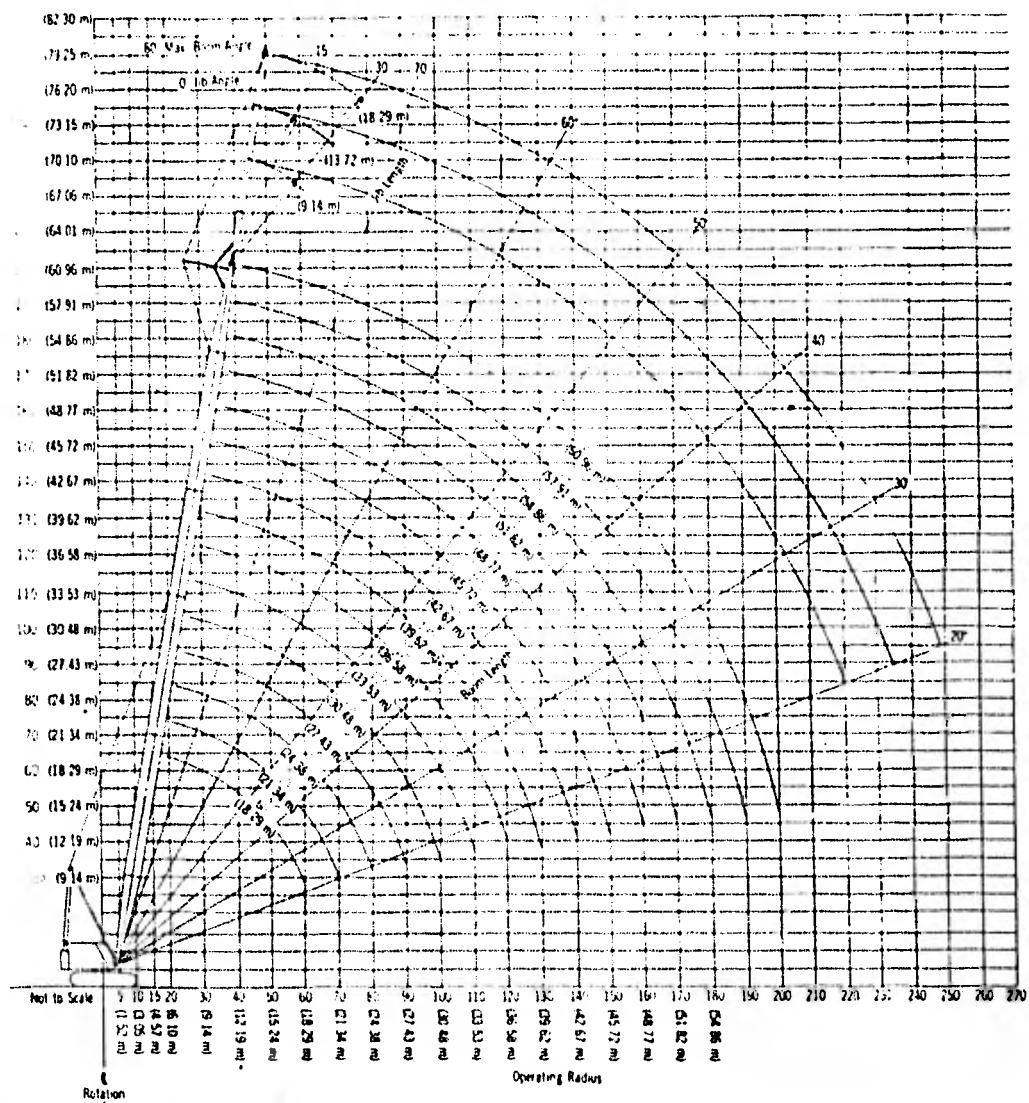

## LS-418A boom/jib working ranges

**Boom — tubular** (1.37 x 1.52 m)  
with or without boom  
live mast; with boom midpoint  
suspension pendants as required.

**Jib — tubular** 5' x 3' (0.76 x 0.91 m).  
**Mounting — crawler**, 11' gauge.  
(7.73 m) overall length

**Counterweights — Refer to charts page**

## Link-Belt LS-418A lifting crane capacities

PCSA Class 13-532  
Refer to Notes page 6.

**Boom** — **tubular** (1.52 m) wide, 54 (1.37 m) deep with  $\frac{1}{2}$  (12.7 mm) top section, with or without boom live mast, and with boom midpoint suspension pendants as required

**Jib** — **tubular** 30 + 36 (0.76 m + 0.91 m)

**Mounting** — **crawler**, 14.0 (4.27 m) gauge  $\frac{1}{2}$  (7.73 m) overall length

**Counterweights** — Refer to charts below.

| Counterweights |           |        |           |
|----------------|-----------|--------|-----------|
| "A"            |           | "AB"   |           |
| Pounds         | kilograms | Pounds | kilograms |
| 24,000         | 10,886    | 63,000 | 28,577    |

Maximum tubular boom or boom + jib machine can lift off ground<sup>①</sup> unassisted — without load.

| Standard machine equipped with appropriate counterweights | Counterweight "A" |        |            |               | Counterweight "AB" |        |            |               |
|---|-------------------|--------|------------|---------------|--------------------|--------|------------|---------------|
|   | Boom              |        | Boom + Jib |               | Boom               |        | Boom + Jib |               |
|   | Feet              | meters | Feet       | meters        | Feet               | meters | Feet       | meters        |
| Over ends   | 24                | 60.96  | 170 + 1    | 51.82 + 18.29 | 220                | 70.10  | 200 + 12   | 60.96 + 18.29 |
| Over sides  | 17                | 51.82  | 140 + 1    | 42.67 + 18.29 | 220                | 67.06  | 190 + 12   | 57.91 + 18.29 |

<sup>①</sup> With boom live mast and  $\frac{1}{2}$  (32 mm) diameter pendants and hook blocks on ground.

Maximum tubular boom and boom + jib machine can lift off ground<sup>①</sup> unassisted and travel with, without load. Based on boom horizontal<sup>②</sup> and minimum travel speed on firm, level supporting surface.

| Standard machine equipped with appropriate counterweights | Counterweight "A" |        |            |               | Counterweight "AB" |        |            |               |
|---|-------------------|--------|------------|---------------|--------------------|--------|------------|---------------|
|   | Boom              |        | Boom + Jib |               | Boom               |        | Boom + Jib |               |
|   | Feet              | meters | Feet       | meters        | Feet               | meters | Feet       | meters        |
| Over ends   | 160               | 48.77  | 130 + 60   | 39.62 + 18.29 | 200                | 60.96  | 170 + 60   | 51.82 + 18.29 |
| Over sides  | 130               | 39.62  | 100 + 60   | 30.48 + 18.29 | 170                | 51.82  | 140 + 60   | 42.67 + 18.29 |

<sup>①</sup> With boom live mast and  $\frac{1}{2}$  (32 mm) diameter pendants and hook blocks on ground.

<sup>②</sup> Hook block carried at boom and jib points. Based on 115 ton(104.31 metric ton) 4-sheave, 2,875 lbs (1,304 kg) hook block and 15-ton(13.6 metric ton), single sheave, 435 lbs (197 kg) ball with swivel hook.

## LS-418A lifting crane capacities

Refer to Notes page 6.

**Boom:** — tubular, 1 1/2" (38 mm) wide, 1 1/2" (38 mm) deep with 1 1/2" (38 mm) top section, with or without boom live mast, and with boom midpoint suspension pendants as required.

**Mounting:** — crawler 14 (4.27 m) gauge, 20' 6" (7.73 m) overall length.

**Counterweights** — Refer to charts page 1

<sup>a</sup> Measured from center of boom head sheave to ground.

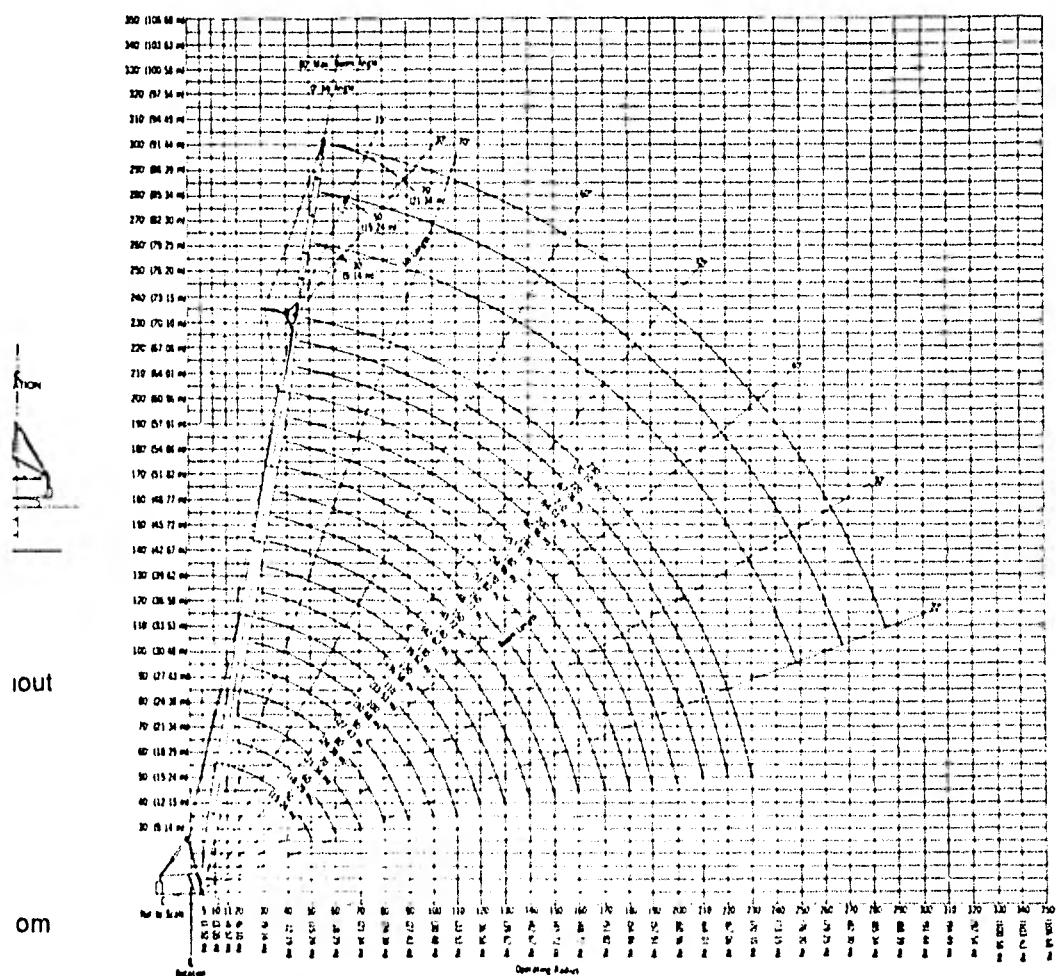

below

### LS-518 boom/jib working ranges

kgf

Boom — tubular, 62" x 70" (1.57 x 1.77 m) Jib — tubular, 30" x 36" (.76 x .91 m).  
with open throat; with boom live  
mast; with boom midpoint suspension  
pendants as required.

Crawler — 16' 0" (4.88 m) gauge.  
24' 4" (7.42 m) over-all length.

PSCA Class 15-773  
Refer to Notes page 6

## Link-Belt® LS-518 lifting crane capacities

**Boom — tubular, 62" x 70" (1.57 x 1.77 m)**   **Crawler — 16' 0" (4.88 m) gauge.**  
**with open throat; with boom live mast;**   **24' 4" (7.42 m) over-all length**  
**with boom midpoint suspension**  
**pendants as required**

**Counterweights — 20,500# (9,299 kg)**  
**ctwt "A" or 90,000# (40,824 kg)**  
**ctwt "AB"**
